

# Land more USDC on every cross-chain swap.

Bridg prices each transfer across 16+ bridges live and routes users to the one that lands the most. We quoted the same 100 USDC on OpenSea's swap and on Bridg at the same instant. Bridg paid more on every route the two share, and it also opens BNB Chain routes OpenSea doesn't offer today.

+89 bps

more USDC landed on SOL → ETH  
(77–105 bps across samples):  
\$8,920 per \$1M bridged

4/4

shared routes where Bridg  
matched or beat OpenSea's  
quote

+2

BNB Chain routes (SOL ↔ BSC)  
Bridg can add to your swap

100 USDC → USDC, SAME INSTANT, PUBLIC UIS      average of 3 synchronized samples per route

## Better fills for your users

Every quote is priced across all venues at request time, so users land the best available amount rather than one provider's price.

## One integration, more routes

Quote, build and submit through one API with no API key. Keys stay with the user, and BNB Chain and dozens of other chains come included.

## Keep part of the upside

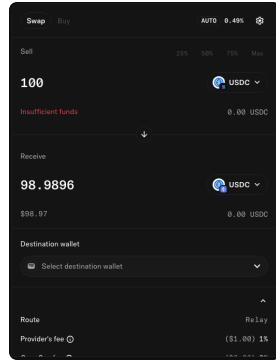

Bridg's referral fields let an integrator take up to 15 bps on the transfers they route, set per quote and with no sign-up.

100 USDC → USDC, read from each site's public page in a fresh browser with no wallet connected; all sites read at the same instant (OpenSea vs Bridg within 8 ms), 2026-09-23 14:18–14:30 UTC. Bridg figures are net of Bridg's platform fee, using its best fully-priced route. Source-chain gas is not counted on either side. Receipts for every route and full method are on page 2.

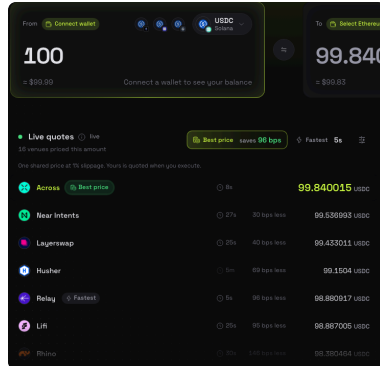

## RECEIPTS FOR EVERY SHARED ROUTE screenshots taken at the moment each value was read (UTC); OpenSea left, Bridg right

**Method.** 100 USDC → USDC, read from each site's public web page in a fresh browser with no wallet connected. Every run typed the amount into all sites at once, then read all values at once. OpenSea's and Bridg's values were read within 8 ms of each other. Campaign 20260923T141817Z, 14:18:55–14:30:58 UTC, 2026-09-23, 3 synchronized samples per route. **Bridg figures** are net of Bridg's platform fee. They use Bridg's best fully-priced route, leaving out venues whose Bridg quote omits a fee charged on top or can't be independently verified (Allbridge, Meson, Husher, Rhino, Eco). On ETH → SOL and Base → SOL that is the CCTP row; the Allbridge row above it adds a ~\$0.36 network fee paid in ETH, which is visible in the screenshot. **Not counted on either side:** source-chain gas the user pays in the native token. **OpenSea** showed a 0% OpenSea fee at the time. Prices move: the SOL → ETH gap reflects Relay's 1% provider fee and elevated Ethereum gas that afternoon.
